

## Copying from Share to Local Mapped Network Drive

This method can be basically the same as *Copying from Share to Local WHS 2011 Formatted Disk*. Please refer to that article for details with the following modifications to those instructions. In this case, the Target drive and folder are presumed by WHS2WHS to have been mapped by you, the user. WHS2WHS will use the **drive letter** of the planTarget volume to formulate the copy command. WHS2WHS automatically detects that the Target drive is a mapped drive, and will format the copy command accordingly.

The copy process will copy from:

\\SourceServer\FolderName to **drive:\**

Again, WHS2WHS will presume that the mapped “drive:\” has already been mapped to the desired Target folder.
